

This Month's "Hot Topic": STATE OF THE ART LIPO

Introducing New FDA Approved Lipoplasty Devices

Dr. Daniel Man
Presenter ASAPS
Hot Topics 2009

Dear Reader,

As we look forward to the Holiday Season, I bring you good news and heartfelt greetings. Because of you our practice continues to grow and I and my staff continue to strive for excellence offering our patients what we believe to be the best and most advanced state-of-the-art procedures. Recently, I have had the honor of participating in the FDA approvals of two new advancements in liposuction devices including: "Body Jet" Water- Jet Assisted Lipoplasty from Germany, and AccuSculpt Laser Lipo from Korea. My paper "Water-Jet Assisted Lipoplasty" was published in the Aesthetic Surgery Journal May/June 2007.

Many patients have expressed a desire for non-surgical options. Lipo RF Radiofrequency is a non invasive alternative that tightens skin and reduces fat. To learn more about these new procedures and how you can find out if you are a candidate please email me at info@drman.com.

Sincerely,
Daniel Man, M.D.
Board Certified Plastic Surgeon

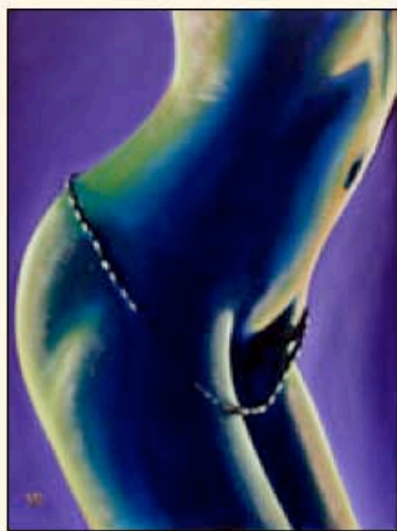

Accusculpt Laser Lipo

Key Benefits: Smaller incision, removes fat with ease, less collateral heat, faster recovery, better results

AccuSculpt is an advanced laser lipo procedure that provides better contours while gently sculpting the face and body. It uses smaller incisions and targets fat cells with less thermal effect to collateral tissues. It is safe for all areas of the body including abdomen, face, neck, thighs, buttocks, back and arms which may be performed at the same time.

Water-Jet Assisted Lipoplasty

Key Benefits: Less irregularities, more accurate, ease of fat removal, minimal discomfort/pain

Water-Jet Assisted Liposuction, also called Body Jet, is a more accurate method of liposuction and may be performed on multiple areas of the body during the same session of surgery including: abdomen, arms, under chin, thighs, buttocks, back, calves. The new device is an improvement of tumescent technique of liposuction.

The Body Jet system is superior to tumescent as it uses a controlled pressure system and special cannula to direct the water in a thin, fan-shaped jet. The pressurized jet stream loosens the fatty structures much more easily and has a special cannula and computerized software that allows control of the rate of fluid input and fat output.

Because it is more accurate, fat is removed only from fatty compartments without harming other important structures like nerves and vessels. It significantly reduces post operative discomfort

or pain. Recovery is shorter as patients often return to work and other activities in a few days.

Lipo RF (Radio Frequency) Melts

A non-surgical alternative for skin tightening and fat reduction
Key Benefits- No downtime, no pain, lose inches, tightens skin

LIPO RF (Radio Frequency) uses a new patented radio frequency technology and offers a non-surgical (non-invasive) alternative for skin tightening and fat reduction. It can be used on multiple areas of the body including: face, neck, abdomen, and arms for body contouring, cellulite removal, fat reduction and melting of deep visceral fat which is associated with overweight and obese conditions. How is it different?

Unlike liposuction procedures which require patients to undergo surgery and anesthesia, the LIPO Radio Frequency fat reduction and skin tightening device uses a bi-polar radio frequency technology. Radio frequency targets fatty tissue because of the high water content, which makes it easy to selectively heat (disrupt the fat cells), and release the melted cells.

Using Bi-polar radiofrequency, the heat is delivered to deep subcutaneous fatty tissues without damaging surface skin. The deep heating effect also tightens tissues and stimulates collagen production. The procedure can also reduce the orange peel, dimpled look of cellulite, and is an effective treatment in reducing stretch marks and firming of sagging skin.

In addition to fat and cellulite reduction, radio frequency has been shown to dissolve fat up to 8 inches deep, around internal organs (called visceral fat). Visceral fat is particularly unhealthy since it increases the risk of heart disease.
